

A2 Guar Korma Meal

A2 Roasted Guar Korma

Guar meal is the by-product obtained during the manufacturing of guar splits from guar seeds (*Cyamopsis Tetragonoloba*). It is a high protein animal and poultry feedstuff. Different kinds of Guar meal are -e.g. - Guar Korma, Roasted Guar Korma, and others. These guar meals can be either used after mixing with other feed stuffs or they can be used by itself. Guar meal is already widely used as a feedstuff due to its high protein content and low economic value compared to other feedstuffs with similar nutritive contents.

After various studies and researches, we at **A2 Trading** are now in the position to offer our clients advanced feedstuffs, like Guar Korma Meal and/or Roasted Guar Korma. Guar Korma is rich in proteins and carbohydrates - meaning pure energy - and offers an impressive profile of essential amino acids.

A2 Roasted Guar Korma is roasted for further improvement: The roasting process of normal Guar Korma at high temperatures leads to a better digestibility by removing the natural, but harmful trypsin inhibitor. Thus particularly our **A2 Roasted Guar Korma** is an ideal protein source for livestock, with most of the germ part of guar seeds preserved. The enhanced digestibility of protein and amino acids in the product results in an increased productivity of livestock and poultry.

Thus **A2 Guar Korma Meal** / **A2 Roasted Guar Korma** reduce the feed costs, as both products provide alternatives to other expensive protein sources such as soya, ground nut, etc.

Both our types supplied by **A2 Trading** - **A2 Guar Korma** and **A2 Roasted Guar Korma** - are natural agricultural products without addition of any chemicals or preservatives, and are Non-GMO products.

Both grades can be used as feedstuffs for

- 1.) Poultry
- 2.) Cattle
- 3.) Aqua Culture
- 4.) Pigs
